Using the HFPI in Florida

It has been noted that the HFPI went from 67 items to 63 items and from 10 to 9 subscales in the Florida validation studies.

Using the HFPI in Arizona

Using the HFPI in Multiple Settings

Some criteria to consider in selecting an outcome measure

- Accuracy of measures in capturing the program goals
- How can we use the HFPI?

- Measuring outcomes to assess the outcome of treatment
- Measuring outcomes: using outcome assessment data to track progress
- Measuring outcomes: using outcome monitoring data to modify treatment as necessary
- Measuring outcomes: working with staff to supervise coaching staff

- Developed the measure with input from home visitors, supervisors, and experts
- Conjoint factor analysis was performed to determine the final 9 subscales of the HFPI
- Reliability: ranged from .76 to .86
- Validity: as demonstrated by the relationship of the HFPI with the Child Outcome Data Evaluation System (CODES) and the Indiana Family Service Plan (IFSP)
- High correlations between total and subscale scores were noted
- Conclusion

The Abstract provides an overview of the study, including the purpose, methodology, results, and conclusions. It highlights the importance of the HFPI as a tool for measuring outcomes in home visitation programs.

The Methods section describes the development and validation of the HFPI, including the use of exploratory factor analysis to identify the final subscales.

The Results section presents the validation studies conducted with different samples in Florida and Arizona, along with statistical analyses to demonstrate the reliability and validity of the HFPI.

The Results section includes tables and figures that illustrate the performance of the HFPI across different subscales. The tables provide information on the reliability and validity of the HFPI, such as Cronbach’s alpha values for each subscale and correlations with other measures.

The Discussion section provides an in-depth analysis of the findings, discussing the implications of the results for the use of the HFPI in home visitation programs. It also addresses potential limitations and future research directions.

The Conclusion section summarizes the key findings and highlights the practical applications of the HFPI in guiding services and measuring outcomes in home visitation programs. It emphasizes the importance of using evidence-based measures to improve program effectiveness and client outcomes.

The training section provides information on how to use the HFPI in supervision, including training options and resources. It also mentions additional modules on types of activities home visitors can use when certain scales are out of range.
