Short and Long Term Impacts of Early Head Start

Helen Raikes and Rachel Chazan Cohen
EHS Research Consortium

Representatives from 17 programs participating in the evaluation, 15 local research teams, the evaluation contractors, and ACF/ACYF

Research institutions in the Consortium (and principal researchers) include ACF (Rachel Chazan Cohen, Judith Jerald, Esther Kresh, Helen Raikes, and Angie Godfrey); Catholic University of America (Michaela Farber, Lynn Milgram Mayer, Harriet Liebow, Christine Sabatino, Nancy Taylor, Elizabeth Timberlake, and Shavaun Wall); Columbia University (Lisa Berlin, Christy Brady-Smith, Jeanne Brooks-Gunn, and Alison Sidle Fuligni); Harvard University (Catherine Ayoub, Barbara Alexander Pan, and Catherine Snow); Iowa State University (Dee Draper, Gayle Luze, Susan McBride, Carla Peterson); Mathematica Policy Research (Kimberly Boller, Ellen Eliason Kisker, John M. Love, Diane Paulsell, Christine Ross, Peter Schochet, Susan Sprachman, Cheri Vogel, and Welmoet van Kammen); Medical University of South Carolina (Richard Faldowski, Gui-Young Hong, and Susan Pickrel); Michigan State University (Hiram Fitzgerald, Tom Reischl, and Rachel Schiffman); New York University (Mark Spellmann and Catherine Tamis-LeMonda); University of Arkansas (Robert Bradley, Mark Swanson, and Leanne Whiteside-Mansell); University of California, Los Angeles (Carollee Howes and Claire Hamilton); University of Colorado Health Sciences Center (Robert Emde, Jon Korfmancher, JoAnn Robinson, Paul Spicer, and Norman Watt); University of Kansas (Jane Atwater, Judith Carta, and Jean Ann Summers); University of Missouri-Columbia (Mark Fine, Jean Ispa, and Kathy Thornburg); University of Pittsburgh (Carol McAllister, Beth Green, and Robert McCall); University of Washington School of Education (Eduardo Armijo and Joseph Stowitschek); University of Washington School of Nursing (Kathryn Barnard and Susan Spieker); and Utah State University (Lisa Boyce and Lori Roggman).
Early Head Start Research and Evaluation Project

- 3,001 children and families randomly assigned to EHS program or control group in impact study with experimental design:

  - Early Head Start Group
  - Control Group

- 17 of first programs funded-center-based, home-based and mixed

- Data collection: 14, 24 and 36 months; prekindergarten and fifth grade follow-up
Impact Analyses: Methods

Regression adjusted, controlling for baseline characteristics, and sites weighted equally

*Reported*: per-participant and intent to treat

Sensitivity analyses- Weighted for missing data

Response rates
  - Response Rate – Family Interview Age 3 = 70%
  - Response Rate – Family Interview age 5 = 69%

Patterns of impacts
Overall Impacts for Children: Age 3

- Higher immunization rate (p<.10)
- Fewer emergency room visits for accidents and injuries
- Cognitive development (higher Bayley scores)
- Larger receptive vocabularies
- Lower levels of aggressive behavior
- Greater sustained attention with objects, engagement of parent, and less negativity
Overall Impacts for Parents: Age 3

- More positive (and less negative) parenting observed in parent-child play: both mothers and fathers
- Higher HOME scores, more stimulating home environments, support for learning
- More daily reading
- Less spanking: both mother and father report
- More hours in education and job training
Overall Impacts for Children 2 Years After Early Head Start

- Decreased behavior problems
- Higher level of positive approaches to learning
- Larger receptive vocabularies for Spanish-speaking children, but not for English speakers
- More likely to be in formal care and education at ages 3-5
Overall Impacts for Parents 2 Years After Early Head Start

- Higher scores on HOME total scale and warmth scale
- Higher on summary of 8 teaching activities
- Higher percentage read to child daily
- Lower risk for maternal depression
- Parent more likely to attend meetings or open houses at child’s program (if child was in a program)
Grade 5
Internal Validity

- Program-comparison differences in nonresponse are small—comparison group has slightly higher nonresponse
- Baseline characteristics of respondents in the program and control groups do not differ significantly

External Validity

- Despite sample loss over 11 years of follow-up, characteristics of respondents at grade 5 are remarkably similar to those of full baseline sample
- More likely to lose lower-educated and highest-risk mothers by grade 5, and those in urban programs
Impacts 7 years later

- Higher scores on child social emotional success index ($p < .10$)
Impacts for Select Program and Family Subgroups
Home-Based Programs

Age 3: Mostly for parents, effect sizes .15-.19
Age 5: Effect sizes .15-.20

- Reduced hyperactivity, behavior problems, and withdrawn behavior
- Positive social skills and approaches to learning
- Increase in applied problems score (W-J)
- Percent reading daily
- HOME total, learning environment, warmth
- Monthly income $2,408 vs. $2,106
Home-Based Programs, continued

Grade 5: Effect sizes .12-.15

- Reduced ADD/ADHD ($p < .10$)
- Fewer parental depressive symptoms ($p < .10$)
- Fewer household moves
- Reduced family conflict ($p < .10$)
- Increased family income ($p < .10$)
Center-Based Programs

Few impacts at age 3 and 5

Grade 5: Effect sizes .26-.34

- Improved social-emotional success ($p < .10$)
- Less retention in school
- Increased parenting stress (both subscales)
Mixed-Approach Programs

Age 3: Effect sizes range from .20-.30
Broadest pattern of impacts for children and families

Age 5: Effect sizes range from .14-.30
- Fewer behavior problems
- Parents more likely to attend open houses or meetings

Grade 5: (all p < .10), effect sizes .17-.20
- More family involvement in school
- Lower parenting distress
- Lower current welfare participation
African Americans
Largest Patterns of Positive Impacts Over Time

Age 3: Effect sizes in the .25-.45 range
- Child: less aggressive behavior, more optimal behavior playing with parent, larger vocabulary, more likely to have IEP
- Family/parent: increased home support for language and learning, more optimal behavior during play, regular bedtime, maternal employment

Age 5: Effect sizes in the .20-.35 range
- Child: less aggressive behavior, improved approaches toward learning, improved attention, larger vocabulary
- Family/parent: more books, parent more supportive in play, less depression, child less likely to live with someone with drug or alcohol problem
African Americans, continued

Grade 5: Effect sizes in the .20-.37 range

- Child-level: less externalizing behavior, anxious/depressed, rule breaking, fewer social problems, fewer attention problems, less likely to be bullied by peers (p < .10)
- Family/parent level: increased family involvement in school, fewer depressive symptoms, less alcohol use; fewer moves and greater support for education internal to the home (p < .10)
Hispanics

Age 3: Effect sizes in the .20-.30 range
- Increased parent support for language and learning
- Increased maternal education (in school or job training)

Age 5: Effect sizes in the .25-.40 range
- Improved approaches toward learning
- Improved Spanish vocabulary
- Fewer speech problems
- Parents more likely to attend open house
- Parents more likely to read daily (p < .10)
- Maternal employment (p < .10)

Grade 5: Effect sizes .22-.23
- Lower academic success (p<.10)
- Maternal educational attainment (p < .10)
Whites

Few impacts at ages 3 and 5

Grade 5 (all p < .10): Effect sizes .17-.21
- Fewer externalizing behaviors
- Less rule breaking behavior
- Less anxious/depressed
- Improved matrix reasoning (WISC subtest)
- Reduced parenting distress
- Reduced family conflict
- Reduced welfare participation
Highest-Risk Families

No impacts at 3 (possible negative for vocabulary)

Age 5: effect sizes .24-.35
- Improved approaches to learning
- Fewer speech problems (p < .10)
- Parents more supportive during play
- Reduced living with someone using drugs
- Reduced neighborhood exposure to violence
- Reduced parent experiencing abuse
- But reduced letter-word identification (negative impact)

Grade 5: Effect sizes .21-.33
- Negative impacts-children’s vocabulary and math
Non-experimental Analysis

How do the accumulation of program and school experiences relate to outcomes?

Classified children based on:

Early Head Start

Formal pre-kindergarten program at ages 3 and 4

Lower poverty school (percentage free/reduced-price lunch less than median)

ANCOVA compared outcomes across the groups
Putting it All Together: Non-experimental At Age 5

Children with EHS and 3-5 fared the best, followed by those with EHS only (for child social-emotional and parent outcomes) or HS/formal program only (for child school-related outcomes).

Important for 0-3 services to be supported by 3-5 services.

NOTE: for Highest Risk families better outcomes if EHS followed by HS
Children with EHS and Formal Care Fared Best: Home Environment
Children with EHS and Formal Care Fared Best: Academic Skills

- Neither: Unaffected children
- EHS Only: Children with Environmental Health Services only
- Formal: Children with Formal Care only
- EHS + Formal: Children with both EHS and Formal Care
EHS Buffered Negative Social Emotional Outcomes Associated with Formal Care

![Graphs showing Aggressive Behavior and Behavior Problems across different care types: Neither, EHS Only, Formal, EHS + Formal.](image-url)
Non-experimental At Grade 5

- More program and educational experiences were associated with better cognitive and academic outcomes in fifth grade.

- Number of cumulative experiences was not associated with social-emotional outcomes.
Cumulative Experience on PPVT-III

Adjusted means:
- None: 89.68
- Any 1: 93.31
- Any 2: 95.84
- All 3: 97.72
Cumulative Experience on ECLS-K Reading

![Bar chart showing adjusted means for PPVT-III scores. The chart includes categories: None, Any 1, Any 2, and All 3. The values are as follows: None = 124.6, Any 1 = 127.43, Any 2 = 130.6, All 3 = 132.15.]
Take Away Messages

Overall, broad pattern of modest impacts at age 3 at finish of program.

On follow up, age 5 impacts sustain in social emotional and parenting areas.

At Grade 5, only a social emotional composite (trend) impact remains. Some subgroups of children and families show long term benefits from EHS.
Take Away Messages

Four notable patterns:

• Sustaining: African Americans had broad impacts that were sustained after the end of the program at age 5 and Grade 5, reducing only slightly.

• Increasing: Impacts of home-based programs and for Whites grew over time.

• Increasing then Diminishing: Impacts for Hispanics and Highest Risk increased from age 3 to age 5 then diminished.

• Diminishing: Mixed-Approach group had initially strong impacts then diminished.

EHS continues to be part of the story, but later experiences and settings influence child outcomes.
