ACKNOWLEDGMENTS

We would like to express our appreciation to our Project Officer Nicole Denmark (Office of Planning, Research, and Evaluation [OPRE]). In addition, we would like to thank Kathleen Dwyer (OPRE) and Rachel Herzfeldt-Kamprath (Health Resources and Services Administration [HRSA]). We would also like to thank OPRE and HRSA leadership for their contributions to this work. We thank the Mathematica team, including Elizabeth Cavadel, Emily Sama-Miller, Brigitte Tran, Colleen Fitts, and Cindy Castro, as well as our team of editors. We also thank our project partners Dr. Ron Prinz of the University of South Carolina, Dr. Darius Tandon of Northwestern University, and Dr. Norma Finkelstein of the Institute for Health and Recovery. Most of all, we offer our gratitude to the home visiting model developers and Maternal, Infant, and Early Childhood Home Visiting (MIECHV) awardee leaders, and Tribal MIECHV grantee leaders, who shared information with us.

We would also like to thank the following members of the project’s expert work group. The views expressed in this publication do not necessarily reflect the views of these members.

The Touchpoints for Addressing Substance Use Issues in Home Visiting (Touchpoints) project generated knowledge about how home visiting programs—including those funded through the Maternal, Infant, and Early Childhood Home Visiting (MIECHV) Program—can engage and support families on these issues. Funded by the Office of Planning, Research, and Evaluation (OPRE) within the Administration for Children and Families (ACF) in collaboration with the Health Resources and Services Administration (HRSA), the project was conducted by Mathematica and its partners, Dr. Ron Prinz of the University of South Carolina, Dr. Darius Tandon of Northwestern University, and Dr. Norma Finkelstein of the Institute for Health and Recovery.

This report provides a summary for researchers, federal staff, home visiting model developers, and program administrators indicating what is generally known and what needs to be learned about how home visiting programs can engage and support families on these issues. The report describes project findings around six touchpoints and four implementation system inputs through which programs can engage and support families to prevent, identify, and address substance use issues (Table ES.1).

A. Background

Home visiting is generally a prevention strategy to support expectant parents and families with young children by offering them “resources and skills to raise children who are physically, socially, and emotionally healthy and ready to learn” (HRSA, 2019). The characteristics of the families served, the outcomes targeted, and the service components delivered vary by evidence-based home visiting model. Depending on the model, home visiting services may be offered to families before the birth of a child and any time up to a child’s entry into kindergarten. As such, services are designed to optimize parenting practices during a critical period in which parents are motivated to pursue behavioral change (Kuo et al., 2013; Lee King, Duan, & Amaro, 2015). At the core of home visiting services is the strength of the relationship between the home visitor and the caregiver, whose trust in the home visitor permits broad conversations around wellness, including candid discussions of sensitive topics like substance use issues and the presence of violence or neglect in the home (Dauber et al., 2017a). In addition, a cornerstone of most home visiting models is the use of community partnerships, including referrals to services such as substance use treatment and adult mental health services; child welfare; child mental health; and health, housing, and nutrition services (HRSA, n.d.). When these referral systems are in place, home visitors can connect families to treatment services they need and coordinate with providers to support ongoing recovery (Dauber et al., 2017a). Moreover, new funding opportunities exist to expand home visiting programs due to legislation passed largely in response to the opioid epidemic. For example, in 2016, the Comprehensive Addiction and Recovery Act amended the Child Abuse Prevention and Treatment Act, requiring states to have a plan of safe care that includes home visiting services and other services and supports for the health and substance use disorder treatment needs of the families of substance-exposed infants (ACF, 2017).

Although home visiting programs can play an important role in engaging and supporting families to prevent, identify, and address substance use issues, several considerations are important to note. First, evidence-based models funded through MIECHV are not designed as substance use treatment interventions, nor can MIECHV funds generally be used for direct services with substance use treatment providers. Rather, home visitors may engage and support families to prevent and identify possible issues. When issues exist or are identified, home visitors may refer families to substance use treatment services.
treatment providers and support them to connect with those providers and, if necessary, engage in treatment and other support services. Home visitors, however, may feel unequipped to address the topic of substance use with enrolled families (Duggan et al., 2018; Harden, Denmark, & Saul, 2010; McDaniel, Tandon, Heller, Adams, & Popkin, 2015; Tandon, Mercer, Saylor, & Duggan, 2008). Second, the prevention and reduction of unhealthy substance use is one of many outcomes that home visiting programs may seek to address. Home visitors often engage families to work toward a wide range of outcomes, including positive parenting, healthy child development, maternal health, and the economic self-sufficiency of families. Finally, because families dealing with substance use issues may be less likely to engage with community support systems, including home visiting programs, LIAs may be less likely to serve this population.

This document summarizes what is known and what needs to be learned about how home visiting programs can engage and support families around substance use issues. The final report presents detailed findings. The findings contribute to existing literature on home visiting and point to specific research areas that may warrant further investigation by stakeholders to better understand how to work with families to prevent, identify, and address substance use issues. Ultimately, research on these areas of interest can contribute to a better understanding of the touchpoints and practices (sometimes referred to as “active ingredients”) that drive improvements in outcomes (Supplee & Duggan, 2019).

B. Research questions and methodology

<td>4. What research opportunities are available to help stakeholders (researchers, federal staff, model developers, and program administrators) understand how home visiting programs can engage and support families to prevent, identify, and address substance use issues?</td>
</tr>
</tbody>
</table>

This final report addresses four research questions from the synthesis of the Touchpoints project’s Phase 1 tasks (see box). Project tasks included:

- Developing an overarching conceptual model to identify the pathways through which home visiting programs can engage and support families to prevent, identify, and address substance use issues
- Developing three detailed conceptual models to further delineate the pathways in the overarching conceptual model
• Conducting an inventory of practices used in home visiting programs to engage and support families to prevent, identify, and address substance use issues, based on information from select home visiting model developers, MIECHV awardee leaders, and Tribal MIECHV grantee leaders

• Conducting a targeted literature review of studies that addressed family substance use issues that can be applied to home visiting

• Consulting with key stakeholders to incorporate information and insights in all project tasks

• Assessing opportunities for future research on engaging and supporting families to prevent, identify, and address substance use issues through home visiting services

The remainder of this document provides a high-level description of study findings to each of the research questions.

C. Summary of findings

1. What are the conceptual touchpoints for how home visiting programs may prevent, identify, and address substance use issues among families? What implementation system inputs support programs to deliver the touchpoints?

The project team developed an overarching conceptual model to represent a comprehensive and broad range of relevant inputs, touchpoints, short- and long-term outcomes, and contextual factors representing opportunities for home visiting programs to prevent, identify, and address substance use issues among families. The project team also developed three detailed conceptual models that take a closer look at constructs in the overarching conceptual model that were identified as high priority by the project’s expert consultants, federal staff, and technical assistance providers that support the states, territories, and Tribal entities that receive funding through the MIECHV Program. Taken together, the four conceptual models present the theoretical pathways through which home visiting programs can engage and support families to prevent, identify, and address substance use issues. Appendix A contains the conceptual models.

The overarching conceptual model was initially developed based on a conceptual framework created for the Maternal and Infant Home Visiting Program Evaluation (MIHOPE)—the national evaluation of home visiting programs under MIECHV—and the Institute of Medicine’s continuum of care model. The project team refined the conceptual model based on findings from the inventory of practices and literature review, as well as feedback from the project’s expert consultants, federal staff, and technical assistance providers. For this project, the team focused on touchpoints that can target working with families to prevent, identify, and address substance use issues, rather than touchpoints that broadly apply to working with families around substance use issues. For this reason, touchpoints of promotion, which are goals of home visiting programs generally (HRSA, n.d.), are listed in a box separate from the touchpoints of focus.

One of the three detailed conceptual models focuses on the implementation system inputs. The other two models focus on touchpoints: one on substance use prevention and the other on supporting families in treatment and recovery. The implementation system inputs model further delineates the pathways by which the constructs from the overarching model may influence the delivery of the touchpoints, identifying how the state-, territory-, or tribal-level entity, home
visiting model, and referral partners influence implementation system inputs and how the organizational- and home visitor-level implementation system inputs influence each other. For example, the state-level agency, such as an MIECHV awardee, may have priorities for ongoing screening of families for substance use issues that influence LIA-level policies and procedures for screening. At the same time, policies and procedures established at the LIA level may feed into decisions the MIECHV awardee makes.

The other two detailed conceptual models—the prevention model and the treatment and recovery model—are companion models that focus on how home visiting programs may deliver the touchpoints differently based on where a family is on the continuum of care. The prevention model is relevant to families identified as at risk for substance use issues, for whom the goal is to prevent the development of substance use disorders. With these families, home visiting staff may focus on screening, as well as coordinating referrals in the event of a possible substance use issue. The treatment and recovery model is relevant to families who have a member who is identified as having a substance use disorder, for whom the goals from a clinical standpoint are to initiate and engage the caregiver in treatment, reduce substance use, prevent drug overdoses, prevent the occurrence of the physical and mental health conditions that often co-occur with substance use issues, and prevent intergenerational substance use. With these families, home visiting staff may focus on coordination with substance use treatment providers. Programs may universally educate families on substance use issues and deliver strategies to prevent and address substance use issues, but the specifics may vary based on where a family is on the continuum of care.

2. What practices are used by home visiting programs to engage and support families to prevent, identify, and address substance use, based on information from select home visiting model developers, MIECHV awardee leaders, and Tribal MIECHV grantee leaders?

To understand some of the ways home visiting programs currently engage and support families to prevent, identify, and address substance use issues, the project team gathered information from 11 model developers, seven MIECHV awardee leaders, and two Tribal MIECHV grantee leaders. Model developers shared information about the policies and guidance they provide to LIAs delivering the models. MIECHV awardee and Tribal MIECHV grantee leaders shared information about statewide and tribe-wide policies and initiatives that are applicable to LIAs. In addition, the model developers, awardee leaders, and grantee leaders shared information about particular LIAs or grantees that were engaged in efforts to address substance use issues. Although most of the practices described in this report are delivered by LIAs, the project team did not collect any information from LIAs directly (other than Tribal MIECHV grantees that are also implementing agencies).

The inventory findings shed light on the practices that programs use at each touchpoint to engage and support families to prevent, identify, and address substance use issues. For example,

---

1 In the case of some Tribal MIECHV grantees, grantee leaders shared information about tribe-wide policies and initiatives that are applicable to themselves if they use MIECHV funds to carry out the activities required to deliver home visiting services to families rather than distributing the funds to LIAs to carry out activities. Most Tribal MIECHV grantees carry out activities themselves.
model developers and Tribal MIECHV grantee leaders described using standardized and non-standardized tools, facilitated discussions, and motivational interviewing as practices to screen families for substance use issues. Similarly, the findings describe the types of practices that support the implementation of the touchpoints, such as approaches to staffing for home visits and training for home visitors (Table ES.2). The inventory findings also highlight key information gaps. Information gaps are areas where more information is needed if stakeholders were to encourage LIAs to implement specific practices related to the touchpoints and implementation system inputs. The gaps fall into two categories: (1) areas where more information is needed because the touchpoint or implementation system input was described in the inventory infrequently, and (2) areas where more information is needed about practices because the touchpoint or implementation system input was described in the inventory more generally. The key information gaps include:

- Understanding if and how home visiting programs include the provision of case management related to substance use issues—such as home visitors working with substance use treatment providers in discharge planning for families exiting treatment programs. This touchpoint was described least frequently by the select model developers, MIECHV awardee leaders, and Tribal MIECHV grantee leaders, which may indicate that many of them consider the touchpoint to be out of scope. However, the touchpoint may be relevant to some models, particularly those that exclusively serve families that self-report substance use issues.

- Gathering more information about MIECHV awardee and Tribal MIECHV grantee monitoring systems to track substance use-related inputs, activities, and outcomes. The inventory findings show that the select awardee leaders generally do not collect substance use-related data beyond model-developer requirements. ACF requires that the Tribal MIECHV grantees collect data on screening and referrals related to substance use issues. Of the two grantees in the inventory, only one grantee leader described tracking substance use-related information beyond these requirements.

- Understanding the specific practices LIAs use to screen families for substance use issues. Inventory findings show that LIAs set many of the policies related to screening for substance use and use a wide range of screening methods and tools. Detail is needed to understand how LIAs select the screening methods tools they use; whether screenings are implemented universally with all enrolled families; whether screenings are conducted at regular intervals or in response to a need identified by a family; and how the screening results are used to inform service delivery.

- Learning more information about how home visitors educate families on substance use prevention, identification, treatment, and recovery. All select model developers described home visitors providing education on substance use issues to families, but with variation in the extent of the education offered. Detail is needed about the content that home visitors provide to families and whether that content is tailored for families based on need.

- Similar to the information gap just discussed, professional development for home visitors on substance use was described by the select model developers, MIECHV awardee leaders, and Tribal MIECHV grantee leaders, but they collectively noted variation in the extent of the training provided. Detail is needed about the content and mode of home visitor professional development.
### Table ES.2. Practices identified in the inventory as described by select home visiting model developers, MIECHV awardee leaders, and Tribal MIECHV grantee leaders, by touchpoint and implementation system input

aUnless otherwise stated, all practices are implemented at the LIA level.

Source: Touchpoints inventory of practices of select home visiting model developers, MIECHV awardee leaders, and Tribal MIECHV grantee leaders, January through September 2018.

Notes: Findings pertain only to those models, awardees, and grantees included in the inventory. Findings are not representative of the full group of models, awardees, and grantees that were active at the time of information gathering January through September 2018. In addition, findings are not based on comprehensive information. For example, the project did not include gathering information about LIAs' day-to-day activities working with families with substance use issues (with the exception of Tribal MIECHV grantees that are also implementing agencies).

Information was not gathered from home visiting model developers, MIECHV awardee leaders, and Tribal MIECHV grantee leaders systematically. However, the document review was systematic and included information synthesis to answer predetermined research questions related to the touchpoints and implementation system inputs.

LIA = local implementing agency; MIECHV = Maternal, Infant, and Early Childhood Home Visiting.

3. **What is the state of evidence on practices for working with families with young children around substance use prevention and supporting families with substance use issues through treatment and recovery that can be applied to home visiting?**

To identify evidence-based practices that can be applied to home visiting programs and to gather descriptive information about the touchpoints and implementation system inputs, the project team conducted a review of recent literature. Specifically, the literature review aimed to address the following questions: (1) What does research that addresses family substance use outcomes say about practices that home visiting programs may use to prevent, identify, and address substance use issues? (2) What does research say about service delivery models that address related outcomes? and (3) How are the touchpoints and implementation system inputs described in the literature?

In total, the project team reviewed 68 impact, descriptive outcome, and implementation studies. Sixty-four studies addressed family substance use outcomes and were related to either
(1) early childhood home visiting models, or (2) other service delivery models delivered in child welfare and physical and behavioral health services with families with young children at risk for or having identified substance use issues (referred to herein as “other service delivery models”). Four studies, recommended by the project’s expert consultants and OPRE and HRSA, were on service delivery models that addressed related outcomes (including parenting, child safety, and permanency).

a. What does research that addresses family substance use outcomes say about practices that home visiting programs may use to prevent, identify, and address substance use issues?

Overall, the review indicated that there is little evidence on the effectiveness of practices that can be applied at each touchpoint and implementation system input. Most studies that measured effectiveness and reported on substance use outcomes addressed substance use within an overall model. Specific practices, such as referring, educating, treating, or preventing substance use, were not tested.

Impacts of home visiting models. Research indicates mixed effects of home visiting models on substance use outcomes, although some models have been effective with some outcomes in individual studies. Five studies reported positive impacts on at least one substance use outcome (Barlow et al., 2015; Green, Sanders, & Tarte, 2017; Kitzman et al., 2010; LeCroy & Krysik, 2011; Olds et al., 2010). All these studies enrolled parents prenatally or soon after the birth of a child; one enrolled pregnant American Indian teens. Four of them focused on outcomes of parents. The measure of parental substance use was different in each of the four studies and included illicit drug and marijuana use, alcohol use, receipt of substance use treatment, and impairment of role functioning due to use of alcohol or drugs. The fifth study, a 12-year follow-up of children enrolled in Nurse-Family Partnership, reported on subsequent substance use among children (Kitzman et al., 2010). These five studies with favorable impacts on substance use were conducted in a mix of urban and rural settings. The findings from the five studies provide some evidence of the potential of home visiting models to address substance use issues. However, these findings must be considered within the context of the findings from all of the impact studies on home visiting models identified in this review. Most of the other studies found no significant effects, and one study found a small significant negative impact on substance use (Michalopoulos et al., 2019). Studies of three home visiting models—Family Spirit, Healthy Families America, and Nurse-Family Partnership—reported improved substance use outcomes. Appendix B contains more information on these studies.

Impacts of other service delivery models. Research on other service delivery models provides evidence on practices that can reduce substance use. Specifically, four studies tested service delivery models other than home visiting to address substance use among pregnant

---

2 The authors of the study concluded that, because there is not a theoretical reason why home visiting programs would lead to increased substance use and previous studies have not found statistically significant increases in maternal substance use, “the totality of the evidence suggests that home visiting is not increasing the prevalence of substance use” (Michalopoulos et al., 2019, p. 59).
women and families with young children. The four studies tested two therapeutic approaches—ecologically based treatment (EBT) and family behavior therapy (FBT); Screening, Brief Intervention, and Referral to Treatment (SBIRT) with motivational interviewing; and monetary incentives. Appendix B contains more information about these studies. Stakeholders may assess the appropriateness and feasibility of either incorporating these practices into home visiting services or encouraging home visiting model developers, LIAs, and home visitors to partner with organizations that offer services that use these practices. Despite the findings of each of the four studies, more information is needed about the efficacy of these models and practices in home visiting services.

b. What does research say about service delivery models that address related outcomes?

Research indicates that service delivery models that address related outcomes—such as parenting, child safety, and permanency—can improve parenting outcomes among caregivers with substance use issues and may improve substance use outcomes. Specifically, four studies tested attachment-based parenting programs and the use of peer recovery coaches or mentors. More research is needed, however, on the effects of these models on substance use. In addition, as with the other service delivery models, stakeholders need to consider the appropriateness and feasibility of coordinating with organizations that offer attachment-based parenting programs or peer recovery coaches or mentors to offer these services to families enrolled in home visiting programs.

c. How are the touchpoints and implementation system inputs described in the literature?

The review found that the touchpoints and implementation system inputs are generally described in the literature as theorized in the overarching conceptual model, but the literature lacks details. To illustrate, the inventory points to efforts to (1) recruit the families with the highest need by partnering with organizations serving these families, and (2) coordinate with external partners (such as through state-level task forces). However, the project team did not identify any studies in the literature review that focused on these topics. Overall, several studies described 8 of the 10 touchpoints and implementation system inputs. Appendix B contains more information about how the touchpoints and implementation system inputs were described in the literature.

---

3 These four studies do not represent the full literature on preventing or treating substance use, because the search terms focused on studies that were relevant to pregnant women and families with young children and had approaches relevant to home visiting services, such as services occurring within the home or within the context of a more coordinated service effort. As a result, the review did not include studies of medication-assisted treatment for substance use disorder, nor did it capture studies on behavioral therapies that were conducted before 2010 or with a population other than pregnant women and families with young children. For a broader discussion of evidence-based treatment for substance use, see Facing Addiction in America: The Surgeon General’s Report on Alcohol, Drugs, and Health (U.S. Department of Health and Human Services, 2016).

4 The project team did not collect, as part of the literature review, information on serving families based on strategies designed to address substance use issues or on monitoring systems to track substance use-related inputs, activities, and outcomes. The touchpoint emerged from information collected about other touchpoints as part of the literature review, whereas the implementation system input emerged from information collected as part of the inventory of practices.
4. **What research opportunities are available to help stakeholders understand how home visiting programs can engage and support families to prevent, identify, and address substance use issues?**

Findings from the inventory of practices and the literature review align with the constructs included in the overarching conceptual model. However, the project team found limited evidence on which touchpoints and practices relate to which outcomes, making it difficult for the conceptual model to fully reflect the pathways through which programs can engage and support families to prevent, identify, and address substance use issues. As such, the model serves as a framework for future research by identifying theorized pathways that require testing. The project team met with the project’s expert consultants to gather input on (1) the constructs in the overarching conceptual model, and (2) the findings from the inventory of practices and literature review. Based on their input and the findings presented in this report, the project team developed research areas to guide future study. Research areas fall into two broad categories:

1. **Building the evidence base on practices that can be applied at the touchpoints.** Research areas include the use of screening results; the types of training that are most effective in equipping home visitors to offer education on substance use prevention, identification, treatment, and recovery to families; and practices to support families in making progress toward their goals.

2. **Exploring implementation system inputs.** Research areas include home visitor competencies and certifications for addressing substance use issues, the presence of substance use issues as a consideration for program eligibility, and the use of monitoring systems to track family retention in referred treatments.

Appendix C contains a list of research areas of interest for the touchpoints and implementation system inputs.

**D. Next steps**

Under the next phase of the Touchpoints project, the project team will seek input from OPRE, HRSA, and stakeholders on priority research areas. The team will then produce a series of brief study design reports that address specific research areas, engaging stakeholders to generate research questions and provide input on study designs. This process will help the team prioritize those research questions that are most feasible and of greatest interest to ACF and other stakeholders and that can be used for a variety of purposes at federal, state, or local levels. The project team will then pre-test potential measurement tools or data collection protocols. Next, the project team will develop a detailed study design that addresses one or more of the priority research questions and write a subsequent report summarizing this study design.

<tr>
<th>Inputs</th>
<th>Touchpoints to address substance use issues across the continuum of care</th>
<th>Short-term outcomes</th>
<th>Long-term outcomes</th>
</tr>
</thead>
</table>
| **Parents/caregivers** | - Socioeconomic and demographic characteristics  
- Pregnant and/or parenting  
- Risk (history of trauma, co-occurring conditions, family history of substance use issues) and protective factors  
- Substance type and severity of use | - Promotion  
- Universal prevention  
- Selective prevention  
- Indicated prevention  
- Treatment and maintenance support | - Parent/caregivers  
- Prevention of/reduction in drug and alcohol use  
- Safe home environment  
- Ongoing access to and use of treatment and maintenance services  
- Ongoing access to and use of social supports  
- Improved health |
| **Home visitors** | - Qualifications  
- Experience  
- Demographic characteristics  
- Attitudes and beliefs about substance use | - Educating families on substance use prevention, identification, treatment, and recovery  
- Serving families based on strategies designed to prevent and address substance use issues | - Parenting  
- Improved parenting attitudes and skills  
- Reduction in parenting stress  
- Enhanced responsiveness |
| **Home visiting models** | - Target population and outcomes  
- Requirements for home visitors’ background and professional development  
- Model components | - Referring families to substance use treatment providers and related supports  
- Coordinating with substance use treatment providers and related supports  
- Providing case management related to substance use issues | - Children  
- Reduced injury-related emergency department visits  
- Increased access to and use of community services |
| **Local implementing agencies (LIAs), referral partners** | - Experiences with substance use  
- Relationships/communication systems  
- Community linkages  
- Organizational climate  
- Leadership and decision-making style | - Expanding parents’ knowledge of child development  
- Promoting positive parent-child relationships  
- Promoting parent or caregiver and child health and well-being | - LIAs  
- Improved referral networks and service coordination  
- Improved ability to support home visitors |

**Implementation system**

- Home visitor level  
  - Home visit staffing  
  - Professional development for home visitors on substance use issues  
- Organizational level  
  - Eligibility, recruitment, intake, and enrollment of families with substance use issues  
  - Monitoring system to track substance use-related inputs, activities, and outcomes  
  - Policies and procedures for ongoing screening of families for substance use issues  
  - Linkages to referral partners that offer families support in addressing substance use issues  
  - Coordination with referral partners to facilitate referrals and exchange information about families  
  - Organizational climate, culture, and leadership and communication systems capable of supporting delivery of the touchpoints

- **Policy factors**  
- **Community context**  
- **Stigma**

Note: Touchpoints are activities involving direct interaction between home visiting staff and families through which home visiting programs can engage and support families to prevent, identify, and address substance use issues
Figure A.2. Detailed conceptual model on implementation system inputs

**State-, territory-, or tribal-level entity**
- Professional development for home visitors on substance use issues
- Eligibility, recruitment, intake, and enrollment of families with substance use issues
- Priorities for ongoing screening of families for substance use issues
- Systems for building linkages with referral partners (medical, behavioral health, and social service providers) that offer families support in addressing substance use issues

**Home visiting local implementing agency (LIA)**
- Eligibility, recruitment, intake, and enrollment of families with substance use issues
- Monitoring system to track substance use-related inputs, activities, and outcomes
- Policies and procedures for ongoing screening of families for substance use issues
- Linkages to referral partners that offer families support in addressing substance use issues
- Coordination with referral partners to facilitate referrals and exchange information about families
- Organizational climate, culture, and leadership and communication systems capable of supporting delivery of the touchpoints

**Home visitor**
- Home visit staffing
- Professional development for home visitors on substance use issues on the following:
  - Understanding personal attitudes and beliefs related to substance use
  - Standardized and non-standardized screening tools and policies for conducting screenings for substance use issues
  - Education for families on the effects of substance use on child development and parenting
  - Strategies for preventing and addressing substance use issues
  - Policies, procedures, and practices for referring families to providers that offer families support in addressing substance use issues
  - Policies, procedures, and practices for ongoing coordination with referral partners, including exchanging information about families

**Referred partners**
- Systems for building linkages with home visiting services at the state-, territory-, tribal-, LIA-level
- Policies and procedures for coordinating with LIAs to facilitate referrals and exchange information about families
- Service options that are accessible, family-centered, trauma-informed, and culturally responsive

**Touchpoints for addressing substance use issues among families**
1. **Screening families for substance use issues**
   - Use standardized measures delivered at regular intervals, supplemented with nonstandardized measures and observations

2. **Educating families on substance use**
   - Provide education on the effects of substance use on child development and parenting
   - More generally, provide information to expand families’ knowledge of child development, promote positive parent-child relationships, and promote family and child health and well-being

3. **Deliver strategies to prevent and address substance use**
   - Engage families in motivational interviewing and goal development
   - Promote positive social support systems

4-5. **Refer families to and coordinate with substance use treatment providers**
   - Link families to medical, behavioral health, and social service providers that offer families support in dealing with substance use issues
   - Follow-up on referrals
   - Exchange information about families across organizations
   - Identify roles and responsibilities across organizations

6. **Provide case management to support families with substance use treatment and recovery**
   - Work with families to support adherence to substance use treatment plans and recovery goals

**SUPPORTING CONDITIONS**

C1: State-, territory-, or tribal-level policies support LIA-level implementation of touchpoints to address substance use issues.

C2: Home visiting model policies support LIA-level implementation of touchpoints to address substance use issues.

C3: System-level efforts (such as task forces) support coordination among home visiting and medical, behavioral health, and social service providers that offer families support in addressing substance use issues.

C4: LIAs have referral partnerships with substance use treatment providers.

C5: Home visitors are trained to engage families in quality relationships and to address substance use issues and have the resources to do so.

C6: LIAs keep families enrolled during substance use treatment period (which may range from days to years).

C7: Families receive touchpoints in addition to typical home visiting services.

Note: Boxes shaded green denote inputs that support the delivery of touchpoints. Boxes outlined in green denote the implementation system inputs that support the delivery of touchpoints. The orange box includes touchpoints where home visiting services can address SUI among families. Gray boxes denote conditions that help support the pathways depicted in the model (detailed in the box below). Solid arrows denote primary pathways; dotted arrows denote possible pathways.
Screen families for substance use issues
- Use standardized and non-standardized screening tools, as well as self-reported information. Could include staff observations of parents/caregivers
- Identify, during home visits, nonverbal signals that indicate that families may be experiencing substance use issues
- Conduct during entry into program and at regular intervals based on provision of services and on the number of months elapsed, stage of pregnancy, and postpartum

Identify families at risk for substance use issues
- Interpret and act on information collected through the screening process

Refer families for substance use assessment and conduct follow-up
- Based on screening results, refer parents/caregivers with a positive screen to substance use services for assessment
- Follow up on referral outcome

Educate families on substance use issues
- Provide information on the effects of maternal substance use (includes physical, cognitive, and social-emotional effects prenatally and in early and later childhood)

Deliver strategies to prevent and address substance use issues
- Support behavior change
- Promote positive social support (includes development of healthier social support systems that do not involve substance use)

Services as usual
- Provide all services built into the standard home visiting model

Parenting practices outcomes
- Improved parenting skills and attitudes
- Improved parent-child attachment

Parent/caregiver health outcomes
Short-term
- Initiation and engagement in treatment if applicable
- Reduction in substance use and other risky behavior such as involvement in unsafe relationships
- Increased access to and use of positive social support systems

Long-term
- Prevention of substance use disorder
- Improved parental health

Child outcomes
Short-term
- Reduction in injury-related ED visits
- Reduction in risk of child abuse and neglect
- Reduction in early developmental delays

Long-term
- Improved child health and well-being, including reduction in substance use and mental health conditions
- Improved child safety
- Reduction in risk of substance use

Figure A.3. Detailed conceptual model on prevention

SUPPORTING CONDITIONS
C1a: Home visitors have access to screening tools and are trained to conduct screening and observe parents/caregivers for signs of substance use issues.
C1b: Home visitors are trained to interpret and use observations and screening results to inform service delivery
C2a: Home visiting models/LIAs have referral partnerships with accessible substance use treatment providers
C2b: Substance use treatment providers are willing and able to work with home visiting models/LIAs to exchange information about parents/caregivers
C2c: Available referral and treatment options are feasible for parents/caregivers
C3: Home visitors are trained to engage parents/caregivers, and have the relevant resources to do so
C4: Parents/caregivers are empowered to change behavior and take advantage of education and other resources
C5: Home visiting models and/or their LIAs identify parents/caregivers with substance use disorders
C6: Home visiting models/LIAs keep parents/caregivers enrolled during substance use treatment period (which may range from days to years)

Note: Boxes shaded orange denote touchpoints where home visiting services can prevent substance use issues among families. The blue boxes are outcomes that may result from delivery of the touchpoints. Gray boxes denote supporting conditions (detailed in the box above).

1 Parents/caregivers may move from at risk for substance use issues (prevention model) to having a substance use disorder (treatment and recovery model) and vice-versa at any time during their participation in home visiting services.

2 Initiation and engagement in treatment is not a health outcome but is included in the box because it is critical to achieving the health outcomes listed.
Figure A.4. Detailed conceptual model on treatment and recovery

- **Identify families with substance use disorders**
  Families may be identified with SUD through the screening and assessment process in the prevention model or they may start home visiting services already identified with a SUD.

- **Refer families to substance use treatment services and supports**

- **Educate families on substance use issues**
  - Provide information on the effects of maternal substance (includes physical, developmental, and social-emotional effects prenatally and in early and later childhood).
  - Provide information on the influence of substance use on parenting behavior.

- **Deliver strategies to prevent and address substance use issues**
  - Support behavior change.
  - Promote positive social support (includes development of healthier social support systems that do not involve substance use including peer recovery coaches).

- **Services as usual**
  - Provide all services built into the standard home visiting model.

- **Provide case management related to substance use issues and coordinate with substance use treatment providers and related supports**

- **Parenting practices outcomes**
  - Improved parenting skills and attitudes.
  - Improved parent-child attachment.

- **Parent/caregiver health outcomes**
  - **Short-term**
    - Initiation and engagement in treatment if applicable.
    - Reduction in substance use and other risky behavior such as involvement in unsafe relationships.
    - Prevention of drug overdoses.
    - Increased access to and use of positive social support systems.
  - **Long-term**
    - Reduction in co-occurring physical and mental health conditions.

- **Child outcomes**
  - **Short-term**
    - Reduction in injury-related ED visits.
    - Reduction in risk of child abuse and neglect.
    - Reduction in early developmental delays.
  - **Long-term**
    - Improved child health and well-being, including reduction in substance use and mental health conditions.
    - Improved child safety.

**Notes:**

1. Parents/caregivers may move from having a substance use disorder (treatment and recovery model) to being at risk for substance use issues (prevention model) and vice-versa at any time during their participation in home visiting services.

2. Initiation and engagement in treatment is not a health outcome but is included in the box because it is critical to achieving the health outcomes listed.

### Table B.3. Touchpoints and implementation system inputs described in the literature

<table>
<thead>
<tr>
<th>Touchpoints and implementation system inputs</th>
<th>Described in the literature</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Touchpoints</strong></td>
<td></td>
</tr>
<tr>
<td>1. Screening families for substance use issues</td>
<td>Many studies described a process for screening families for substance use issues, with most noting the use of self-report screening tools. These studies described identifying whether an individual may be at elevated risk for substance use issues, may show prediorder signs but not qualify for a substance use disorder diagnosis, or may have a substance use disorder.</td>
</tr>
<tr>
<td>2. Educating families on substance use prevention, identification, treatment, and recovery</td>
<td>Few studies described educating families to prevent or address substance use; rather, substance use was addressed if identified as a need. One study described specific education to prevent substance use among families. A survey of Tribal MIECHV home visiting programs reported that many programs offered supplemental preventive services that focused on educating parents on the risks and impacts of substance use on infants and children (Novins et al., 2018). Four of the programs surveyed reported including tribal worldviews in their substance use education materials. In other studies, substance use was generally addressed if identified as a need.</td>
</tr>
<tr>
<td>3. Serving families based on strategies designed to prevent and address substance use issues</td>
<td>Several studies described preventing and addressing substance use issues among families by using motivational interviewing in goal development for behavior change or by engaging family and friends. Motivational interviewing is sometimes used in home visiting services to address substance use issues (Damashek et al., 2011) and engage families on a wide variety of challenges, such as service engagement, resource utilization, employment, education, depression, and intimate partner violence (Damashek et al., 2011; Dauber et al., 2017b). Motivational interviewing was a component of SafeCare+, Durham Connects/Family Connects, and the HELP enhancement.</td>
</tr>
<tr>
<td>4. Referring families to substance use treatment providers and related supports</td>
<td>Few studies focused on referring families to substance use treatment providers; studies typically discussed referrals to treatment in the context of SBIRT interventions or as part of efforts to coordinate services. Some studies described referrals made as follow-up to a screen and referral to treatment or SBIRT intervention, while others cited capacity issues among treatment provider agencies and the lack of specialized care and supportive services as significant barriers to successfully making referrals to substance use treatment. For example, Novins and colleagues (2018) found that Tribal MIECHV home visiting programs experienced challenges finding residential substance use treatment programs that allowed parents and their children to stay together while the parents engaged with treatment. MIHOPE stressed the importance of local programs’ perceptions about the availability, accessibility, and effectiveness of services, which all may influence referral practices. In the study, less than half of all local programs reported having available, accessible, and effective services for treatment of substance use and mental health (Duggan et al., 2018).</td>
</tr>
<tr>
<td>5. Coordinating with substance use treatment providers and related supports</td>
<td>Few studies described forming close coordination among community service organizations in an effort to improve substance use outcomes for families. For example, according to MIHOPE, about a quarter of local programs reported having an MOU with at least one in-agency provider or outside provider for substance use and mental health treatment, a designated point of contact, and good or excellent coordination (Duggan et al., 2018). Another study compared the outcomes of families enrolled in a collaborative, higher-intensity home visiting service model—the Partnership Program—to clients enrolled in a referrals-only public health home visiting program (Haynes et al., 2015). In the Partnership Program, families benefited from coordinated service delivery from a family support worker (the home visitor) and public health nurse, as well as access to a mental health caseworker and child care provider, all of whom met monthly to discuss family progress and next steps.</td>
</tr>
</tbody>
</table>
TABLE B.3 (Continued)

<table>
<thead>
<tr>
<th>Touchpoints and implementation system inputs</th>
<th>Described in the literature</th>
</tr>
</thead>
<tbody>
<tr>
<td>6. Providing case management related to substance use issues</td>
<td>No studies discussed case management related to substance use issues in home visiting services, but case management was discussed in detail in the literature of other service delivery models. Case management in the context of substance use treatment typically includes assessment services, development of a care plan, linkages and referrals, monitoring and follow-up, and advocacy and support (Center for Substance Abuse Treatment, 2015). Many of these functions overlap with components of early childhood home visiting services, which include, among other services, assessment of family needs and referral to, and coordination with, needed services (Michalopoulos et al., 2015).</td>
</tr>
</tbody>
</table>

Implementation system inputs

| 1. Home visit staffing (staff characteristics and staffing structure) | Home visit staff described in the literature were either paraprofessionals or health care professionals; some interventions used a team approach, including staff from multiple disciplines to address families’ needs. Although no studies explicitly connected home visitor characteristics to the delivery of touchpoints, the project team found that studies described a range of characteristics of staff that delivered services to families, with variation largely driven by the staffing requirements for each model. Some models hired paraprofessionals to work directly with families, and others hired nurses as home visitors. Studies of other service delivery models described hiring therapists to work with families. |
| 2. Professional development for home visitors on substance use issues | Studies found that, when home visitors received professional development on the topic of substance use, they were more likely to address the topic with families. However, few studies of home visiting models discussed substance use-specific training and supervision; studies of other service delivery models provided more detail on professional development but rarely discussed the content. Several studies found associations between providing professional development on the topic of substance use to home visitors and the rate at which they addressed the topic with families. For example, in a survey of 159 Healthy Families America and Parents as Teachers home visitors, greater substance use training was associated with greater knowledge and self-efficacy regarding substance use issues, and both training and experience were associated with home visitors addressing substance use issues in their current practices (Dauber et al., 2017a). |
| 3. Eligibility, recruitment, intake, and enrollment of families with substance use issues | Studies of home visiting models were broadly targeted to families with low-incomes and living in high risk communities, whereas other service delivery models that focused on substance use outcomes typically had more targeted eligibility, recruitment, intake, and enrollment strategies for families with an identified or potential substance use issue. MIHOPE found that, in a sample of 88 home visiting programs, most (59 percent) considered, but did not require, substance use as an enrollment criterion, and only a few (2 percent) required the mother to report substance use (Duggan et al., 2018). Studies of the other service delivery models found high enrollment rates of participants with substance use issues; and, by design in some studies, all participants screened positive for substance use. |

Note: The project team did not collect, as part of the literature review, information on monitoring systems to track substance use-related inputs, activities, and outcomes.

HELP = Home Visitation Enhancing Linkages Project; LIA = local implementing agency; MIECHV = Maternal, Infant, and Early Childhood Home Visiting; MIHOPE = Mother and Infant Home Visiting Program Evaluation; MOU = memorandum of understanding; SBIRT = Screening, Brief Intervention, and Referral to Treatment.

Table C.1. Research areas of interest for the touchpoints and implementation system inputs

<table>
<thead>
<tr>
<th>Touchpoints and implementation system inputs</th>
<th>Research areas of interest</th>
</tr>
</thead>
</table>
| **1. Screening families for substance use issues** | • Reach of screening and screening rates (including whether screening is universal or targeted and, if targeted, how many families are screened)  
• Screening tools used to screen for substance use and their validity (including which screening tools are used, whether they are standardized, and whether they are valid for their respective populations)  
• Selection of screening tools (including which personnel select the tools and their process of selection)  
• Processes and procedures for administering screening (including staff responsible, staff training, and frequency/timing of screening)  
• Organizational systems for tracking screening (including how the occurrence of screening and screening results are documented)  
• Use of screening results (including how screening results are used to inform service delivery)  
• Use of SBIRT in home visiting services to identify families with substance use issues and connect them with substance use treatment providers (including what an SBIRT workflow may look like) |
| **2. Educating families on substance use prevention, identification, treatment, and recovery** | • Content, mode, and dosage of education (including which types of educational content, such as content on behavioral and emotional regulation, and which modes of education, such as motivational interviewing, are most effective in preventing and addressing substance use issues)  
• Whether and how home visitors tailor education based on family needs (including whether home visitors offer different types of education to families based on their needs along the continuum of care)  
• Content of home visitor training on education strategies (including which types of training—such as informational training, reflective supervision, role playing, and observation-based feedback—are most effective in equipping home visitors to offer education to families) |
| **3. Serving families based on strategies designed to prevent and address substance use issues** | • Using motivational interviewing to engage families in goal development to change substance use-related behaviors (including how home visitors can best use motivational interviewing for screening and education)  
• Promoting positive social support (including strategies that encourage and support families to participate in positive social support systems regarding substance use issues)  
• Engaging relatives and friends in the process of working with families to prevent and address substance use issues (including strategies for effective engagement)  
• Promoting positive parent-child relationships by enhancing home visiting services with attachment-based parenting programs (including how attachment-based parenting programs and practices can be best incorporated into home visiting services to prevent and address substance use issues) |
<table>
<thead>
<tr>
<th>Touchpoints and implementation system inputs</th>
<th>Research areas of interest</th>
</tr>
</thead>
</table>
| 4. Referring families to substance use treatment providers and related supports | • Strategies to facilitate the referral process (including whether and how home visitors help families make appointments with referral sources and follow up with families to confirm they have made appointments)  
• Referral networks with local treatment centers, mental health providers, and domestic violence programs to provide wraparound services (including whether and how organizational-level connections are developed and maintained) |
| 5. Coordinating with substance use treatment providers and related supports | • Practices to promote coordination (including methods for establishing roles and responsibilities and information-sharing agreements across community agencies)  
• Practices to support families in making progress toward their service goals (including whether and how home visitors check in with families at regular intervals about their progress and, with family permission, share information across organizations about families’ progress)  
• Coordination with peer recovery coaches to provide ongoing support to families during treatment and recovery  
• Coordination with medication-assisted treatment programs, behavioral therapies, and recovery support services  
• Financial or in-kind incentives to families to encourage specific behaviors or outcomes (including how families may be incentivized to enroll in substance use treatment and attend treatment sessions and appointments)  
• Other community-level factors that may facilitate or inhibit the effectiveness of referrals (including whether service deserts affect referrals) |
| 6. Providing case management related to substance use issues | Given limited information on specific practices for this touchpoint in the inventory of practices and literature review, more information is needed to identify research areas of interest. This may involve considering an implementation study in consultation with federal stakeholders and experts. |

**Implementation system inputs**

| 1. Home visit staffing (staff characteristics and staffing structure) | • Home visitor education (including the last level of educational attainment and field of study)  
• Home visitor training in or experience with addressing substance use issues (including whether home visitors have previous professional experiences dealing with substance use issues)  
• Competencies and certifications for addressing substance use issues (including whether state-certified home visitors appear better equipped to help families address substance use issues)  
• Team approach, including staff from multiple disciplines (including whether home visitors work in dyads or groups with other professionals)  
• Cultural competencies of staff (including whether home visitors are culturally competent to work with families in a given community or of a particular race or ethnicity) |
### TABLE C.1 (Continued)

</table>
| 2. Professional development for home visitors on substance use issues | • Home visitor training and supervision (including the types of training and supervision home visitors receive, such as reflective supervision, and the topics and strategies covered, such as substance use issues, opioid use disorder, neonatal abstinence syndrome, and FASD; SBIRT; motivational interviewing; and ongoing recovery support)  
• Supervisor training in reflective supervision, role playing, and observation-based feedback (including which types of training are most effective in equipping supervisors to oversee and guide home visitors in working with families dealing with substance use issues)  
• State-level initiatives (including guidelines about screening and other resources related to substance use issues, training in mental health, and an addiction helpline for home visitors to call) |
| 3. Eligibility, recruitment, intake, and enrollment of families with substance use issues | • Referral networks with local treatment centers, mental health providers, and domestic violence programs to provide wraparound services (including whether referral networks facilitate the making of referrals and which procedures best allow organizations to share referrals with each other)  
• Presence of substance use issues as a consideration for program eligibility (including whether targeted home visiting models are more effective at serving families with substance use issues)  
• Differences in eligibility, recruitment, intake, and enrollment policies and procedures (including identifying policies and procedures that best recruit and enroll families affected by substance use issues) |
| 4. Monitoring systems to track substance use-related inputs, activities, and outcomes | • Monitoring systems at the home visitor level that may facilitate interactions with families about substance use issues (including monitoring of families screened for substance use issues; results of screening or observation; delivery of education on the effects of substance use issues during home visits; families referred to substance use assessment and treatment; family engagement with referred treatments; family retention in referred treatments; and barriers to family engagement with, and retention in, referred treatments)  
• Monitoring systems at the state, territory, tribal, and home visiting model levels that influence LIAs and, in turn, the delivery of touchpoints (including which types of monitoring systems are most accessible and less burdensome to implement) |

FASD = fetal alcohol spectrum disorders; LIA = local implementing agency; SBIRT = Screening, Brief Intervention, and Referral to Treatment.
